CARE GUIDE

Stone Cladding

Stone cladding brings natural texture and warmth to any wall. It asks very little in return, just gentle cleaning and a few simple precautions to keep it looking its best.

01

Everyday care

- Brush off loose dust and dirt with a soft brush.
- Rinse with clean water at low pressure.
- For a deeper clean, use warm water and a mild, pH-neutral cleaner.

02

What to avoid

- No acid-based cleaners, they can etch and discolour the surface.
- No high-pressure washing at close range, it can damage the face and joints.
- No harsh scrubbing or wire brushes.

03

Sealing

Sealing is optional. A breathable, penetrating sealer made for stone can help repel water and staining, especially in exposed or high-traffic areas. Reapply as directed by the sealer maker.

04

Outdoor & exposed areas

Weather and efflorescence

Keep sprinklers and constant water off the stone where you can.

A white powdery bloom (efflorescence) can appear on new work. It is a natural mineral deposit and usually weathers away or brushes off once dry.

A NOTE ON NATURAL STONE

Variation in colour, veining and texture is the character of natural stone, not a defect.

05

Keep in mind

- Avoid de-icing salts and harsh garden chemicals near the stone.
- Keep the base clear of soil and mulch build-up.

This care guide is general information only. Always follow the care instructions supplied with your product. If you are unsure, please contact OnWood Tiles.
